Can be interpreted as a sequence of words (or **tokens**)

Classic NLP tasks: Text categorization, sentiment analysis, translation

Vocabulary construction

build words using symbols/letters, then indicise words as **tokens**

$$\left[\underbrace{\text{The}}_0, \underbrace{\text{quick}}_1, \underbrace{\text{blue}}_2, \underbrace{\text{fox}}_3, \underbrace{\text{is}}_4 \right]$$

Now 'The fox is quick' = [0, 3, 4, 1]

How to obtain Embeddings?

- **Old way:** load pre-computed word embeddings (e.g. word2vec, fastText) [King-Queen]
- **Modern way:** Learn word embeddings jointly with the main task.
 - ▶ Start with random word embeddings and then learn word embeddings in the same way you learn the other weights of the neural network.

<i>[EOS]</i>	[0.2, -0.1, 0.0, 0.5, 0.1, 0.0, 0.0, 0.2, 0.01, 0.0]	0
<i>the</i>	[0.2, -0.1, 0.1, -0.5, 0.1, -0.08, 0.04, 0.2, 0.01, -0.3]	1
<i>Have</i>	[0.2, -0.1, 0.45, -0.5, 0.1, 0.8, 0.4, 0.2, 0.01, -0.3]	2
<i>a</i>	[0.2, -0.1, -0.9, 0.5, 0.1, -0.3, 0.4, -0.4, 0.01, -0.3]	3
<i>good</i>	[0.2, -0.1, 0.9, 0.5, 0.1, 0.8, 0.4, 0.2, 0.01, -0.3]	4
<i>great</i>	[0.2, -0.1, 0.9, 0.5, 0.1, 1.0, 0.4, 0.2, 0.01, -0.3]	5
<i>day</i>	[0.2, -0.1, -1.3, 0.5, 0.1, 0.8, 0.4, 0.2, 0.01, -0.3]	6

d

Word emb: 

Tokenizer: [2, 3, 4, 6]
[“Have”, “a”, “good”, “day”]

Input Sequence: *Have a good day*

Figure 1: Embedding Table $\in \mathbb{R}^{V \times E}$

Table lookup is **much faster** as it avoids **BIG** matrix multiplications

Recurrent Neural Networks

family of neural networks for processing sequential data

- RNNs share parameters in a different way
 - Each member of output is a function of previous members of output
 - Each output produced using same update rule applied to previous outputs
 - This recurrent formulation results in sharing of parameters through a very deep computational graph

Figure 2: An unrolled RNN

RNNs share same weights across Time Step

To go from multi-layer networks to RNNs:

- Need to share parameters across different parts of a model
- Separate parameters for each value of input cannot generalize to sequence lengths not seen during training
- Share statistical strength across different sequence lengths and across different positions in time

Problem of Long-Term Dependencies

2 examples

- Easy to predict last word in “the clouds are in the **sky**”
- I grew up in France...[an entire story]... I speak fluent **French**.”

In principle RNNs should handle it, but fail in practice. LSTMs offer a solution

Backpropagation-through-time

Unfold the computational graph

A Computational Graph is a way to formalize the structure of a set of computations (Backpropagation in this case)

- Unfolding this graph results in sharing of parameters across a deep network structure

Say that $s^{(t)} = f(s^{(t-1)}, \theta)$

Figure 3: Classical dynamical system

Lets include the last state as well

$$s^{(t)} = f(s^{(t-1)}, x^{(t)}, \theta)$$

Now state now contains information about the whole past input sequence

Three design patterns of RNNs

Design 1

Figure 4: Design 1: Output: each time step; Recurrence: hidden units

Forward Calculation

We need to specify initial state $h^{(0)}$, then for each time point:

$$a^{(t)} = b0Wh^{(t-1)} + Ux^{(t)}$$

$$h^{(t)} = \tanh(a^{(t)})$$

$$o^{(t)} = c + Vh^{(t)}$$

$$\hat{y}^{(t)} = \text{softmax}(o^{(t)})$$

The Loss function can simply defined as the sum of the loss at each timepoint:

$$L = \sum_t L^{(t)} = - \sum_t \log p_{\text{model}}(y^{(t)} | \{x^{(1)}, \dots, x^{(t)}\})$$

Gradient Calculation (backward)

Computing this loss function *w.r.t* θ is very expensive

Requires forward propagation pass through the unrolled graph

Runtime is $\mathcal{O}(\tau)$ and cannot be reduced by parallelization

Figure 5: back-propagation through time or BPTT

Design 2

Figure 6: Design 2: Output: each time step; Recurrence: output units

Recurrence from Output to Hidden

Design 3

Figure 7: Design 3: Output: one at the end; Recurrence: hidden units

Teacher Forcing

Figure 8: Visualizing Teacher Forcing

LSTM (long short-term memory)

LSTMs are explicitly designed to avoid the long-term dependency problem

Figure 9: RNNs have the form of a repeating chain structure

Figure 10: LSTMs also have a chain structure
